With the recent pace of the pulse oximetry sensors, it has become necessary to provide a mechanism to replace a sensor once it has failed to provide good data for a period of time. One approach is to use a pair of sensors in combination to double the time the sensor can run before it must be replaced. Combining sensors requires a sensor interface that allows the two sensors to be sensed at the same time in an independent manner. Generally, this is done by placing a sensor in close proximity to the other sensor. The proximity of the two sensors changes the amplitude and phase of the signals received from them. Thus, the outputs of two sensors placed in proximity to each
