The best thing about xpad is its flexibility. You can change the frequency of the pulses and set their duration. You can add a switch to the mode. It is therefore possible to convert XPad into a voltage clamp or a current clamp. To learn more about this, see the section on electrophysiology. Markup Code for

Xpad implements the ITU-T V.41 General Framing Procedure, Part 1, Clauses 6 and 7: the T-C 30 line code and the T-C 64 character code. Hi Praja,Received the XPad today, I have a question about using a voltage clamp, and running through the common block. It says, "Voltage Clamp, XIdle mode. Does that mean I can not run my common block in the voltage clamp mode? Is there another way to do this?Thank you,Cindy Hi Andy,For testing purposes I use a 4-wire voltage clamp with my Xcell to power the XPad, and your cables. I use the terminal 8/24V for the V-clamp. At room temperature, my Xcell output is still over 10V, but with a current clamp it would be much lower. You can not enable the voltage clamp with the X-Clamp. That is not possible. The X-Clamp runs a wide variety of modes, including voltage clamp, current

clamp and voltage clamp/current clamp. If you actually want to do the voltage clamp, you have to use an instrument that is designed for that and it is much more complex than your X-Clamp is. Thanks for the help. I was using my voltage clamp the other day and the my voltage in the clamp went to 6-8 volts. Than I used my current clamp and it immediately shot to zero. Do you know why this happened? Hello,Thanks for the help. It's almost a week I am trying to figure out if the X-clamp is good or not. That's why I got so confused when I started the voltage clamp.Do you have an idea about what causes the voltage in the clamp to go up and down. I would appreciate your help.Cindy Hello,That is
