. Mishkat ء . Mishkat is the Urdu name of the book which is written in Classical Arabic. Miszkha.com has a vast collection of Urdu. Mishkat Arabic Pdf Download99: Mishkat Al Masabih Arabic Pdf Download99In order to light up, flashlight assemblies, such as employed in a flashlight operated work implement, for example, a rotary and reciprocating agricultural harvester, have heretofore employed a semiconductor type of device, such as a light emitting diode (LED) light source in an alternating current (AC) circuit to produce a strobe effect. In an effort to conserve electrical energy, systems for minimizing the power consumption of such strobe light illumination have also been employed. For instance, a known prior art flashlight bulb circuit is depicted in FIG. 1. The flashlight bulb circuit of FIG. 1 is driven by a DC power source, such as a battery, through a switch 101. A light emitting diode 103 is connected in series with the switch 101. The light emitting diode 103 has a cathode terminal 103a and an anode terminal 103b. An output from the light emitting diode 103 is connected to the input of a rectifying bridge 104 which forms a DC power source for the light emitting diode 103. The rectifying bridge 104 is not driven by a DC power source. However, the rectifying bridge 104 does rectify an AC voltage into a DC voltage and a capacitor 107, which is typically polarized, provides a load to the rectifying bridge 104. When the switch 101 is closed to provide the DC power source, the capacitor 107 receives a low level AC voltage of typically 20-40 volts and provides the rectifying bridge 104 with a current flow through the light emitting diode 103. The light emitting diode 103 is continuously driven at a point of 100-200 milliamps (mA) and this current flow causes the light emitting diode 103 to produce a light output. In operation, the switch 101 is closed and the capacitor 107 receives the low AC voltage from the battery and provides the rectifying bridge 104 a continuous flow of current to the light emitting diode 103. Upon closing the switch 101, the light emitting diode 103 will stay lit for about 10,000 hours before it burns out and must be replaced. Typically, the low power light emitting diode 103 produces a light output that has a maximum luminous flux of 6.5 milliwatts per square centimeter. Thus,
