parameter for setting up serial communications is setting a baud rate. Best to think of it as how many bits a second are transmitted. Typical speeds follow old-time modem rates such as 1200, 9600, 19200, 57600, 115200, 256000, and 1 megabit. While setting non-standard rates may be possible with software serial, hardware may only accept fixed rates. For microcontrollers, 9600 is a typical slow rate and 115200 often a fast rate. Check your hardware specifications (spec) sheet for the baud rates the board supports. Leveraging serial communications for sensing applications can involve a variety of edge-sensitive sensors. Some of the best known sensors would be the CCD sensors used on motion picture cameras. This sensor uses a CCD chip to view the capture of an image through a physical imaging sensor. Audio Adapter for XBOX 360 with Stereo audio output, supports XBOX serial cable as well. It supports XBOX autodetection system or users can manually select the XBOX X port or Y port by pressing the red power button. The audio adapter can work with XBOX serial cable with length of 0.5m. 32 bit serial links operating between synchronous serial devices are, in general, asynchronous. The signals are derived from the same clock, however, the link is generally asynchronous to other circuits because it begins and ends with a valid start condition. Writing to the serial port and reading from the serial port will not work because the terminals are not connected to the serial port. This means that your

microcontroller will not be able to communicate with any attached device. If you are using software serial, make sure that you are sending and reading from the correct serial port.

Here is a simple program to write the light level and temperature read by the Circuit Playground Express to a serial interface. The serial redirect block sets up the communication pads and the baud rate. The program below uses the pads marked TX and RX for transmit and receive. If you use other pads, they will work but you are not using the hardware serial on the board but a software serial code function which is fine for the low transmission rates allowed by the block (no greater than 115,200 baud).

The 7803ec low-profile PCI Express serial interface provides eight RS-232 serial ports. All modem control signals are implemented for maximum compatibility with a wide range of serial peripherals. Each serial port features an ultra high-speed UART, flexible clock prescaler, and large 256-byte Tx/Rx FIFOs allowing the adapter to support the widest range of standard and non-standard baud rates to 230.4 Kbps. These features make the 7803ec ideal for data-intensive applications that require reliable, fast throughput rates. The T-Max Ettore RS-232 Serial Interface PCI Express Adapter Card is a low-profile PCI Express RS232 serial interface with seven high-performance RS-232 data ports that support the latest PC communications industry standards and the RS-232 compliant 10/100Base-T Ethernet interface, embedded Real Time Clock (RTC), and universal 8-bit parallel I/O capability. The Ettore Serial Interface PCI Express Adapter

Card features the Ettore UART technology that virtually eliminates the inherent problems of non-standard RS-232 control and data signals. The UART technology allows for the full RS-232 control of data, receive, and transmit signals, features a high level of immunity to EMI and RFI, features a high data bus performance, and offers the widest range of baud rates available on the market.
