At this point, the only Adobe Creative Cloud implementation of which I've been really disappointed is the cloud-based video processing feature. The Blackmagic daemon handles substantial film-based camera files, such as RAW photos and video files. However, the best thing about a daemons is the complete lack of codec changes. However, that feature has always had issues. Color handling, bugs with the codec, and glitches with the blackmagic app itself are all issues that are real and ones that I see potential solutions to. Until these problems are solved, I can't recommend Adobe Creative Cloud for video editing. I find it convenient, but it certainly isn't perfect. I'm sure that one day this will change. For now, if you have an external editor and RAW-only workflow, I'd recommend using their paid plans to access the greatest number of features. At this point, there really isn't a reason to move to a cheaper, but less powerful, alternative. The only feature **I'm missing** is the ability to execute large batches of images with modified presets, which is a feature that Adobe's Ansel app excels at. However, since I personally haven't experienced a need for it, I haven't held a negative impression of that particular feature. **ABOVE:** An image was created in Adobe Photoshop on the Mac with the same app on a Windows 10 PC. **BELOW:** All the same tools were used in Adobe Lightroom to create the same set of images. While the images look the same, the Windows 10 image shows the Windows 10 signature on the desktop. On the Mac, the same window is available by pressing Command, Option and Cmd as well as swapping app to the side.

It's surprisingly simple to use the Fill tool, especially when you take advantage of the Gradient tool and "edit" the color sliders using your mouse to make things happen naturally and visually—a process that's almost impossible to imagine in the more rigid linear approach of traditional "process" software. The Gradient tool offers a slowly fading color gradient effect for all kinds of colors—from light to dark, or dark to light. All you really need to do with this tool to make it work is remember to hold down the Shift key to get a dark mode gradient. **What It Does:** The Adjustment layer lets you chemically adjust any of the image's color, brightness, contrast, or sharpness—or effectively combine those adjustments into one—after you've made a picture adjustments. You can use them to change the color appearance of any shape or object you choose or to shift a picture beyond the visible spectrum. **What It Does:** The Adjustment layer lets you chemically alter any of the image's color, contrast, sharpness, or brightness, or essentially combine adjustments into one, after you've made a picture adjustment. You can use adjustments within the Adjustment Layers group to shift a picture beyond the visible spectrum, or to create a dark-on-light or light-on-dark color contrast, for example. You can also create a portrait effect or reproduce the look and feel of a specific film stock, for example. **What It Does:** The Adjustment layer lets you create a portrait. You'll use the Hue/Saturation adjustment to clone a color from one part of the picture to replicate that color in the eyes or in the mouth, for example. You can also use the Adjustment layer to shift a picture beyond the visible spectrum. e3d0a04c9c

“ I realized the control was pretty limited and it thoroughly confounded me. There simply wasn't enough of a palette of colors to work with. If I wanted great contrast and a range of colors, I had to either accept the limitations of the tool or pick the closest paintable color and then work up from there. Doing this with a tiny selection of colors was a bit more work than I wanted.
